

Project Management

As the largest provider of UST compliance services in the world, with literally dozens of tests and services specific to the integrity of fueling systems, we are involved in all aspects of our clients' site compliance.

Frequently, in the course of our testing, inspection or other services work, our customers request that we provide or manage additional services that are closely related to the core compliance work we are performing. Our dedicated Project Management Team is the group which handles these specific and often unique projects.

Here are some examples of the type of work our Project Managers can manage for you:

- Site surveys
- Spill bucket replacements
- Automatic Tank Gauge (ATG) upgrades, replacements, or installations.
- STP replacement
- Sump replacement
- Product or vent piping repair or replacement
- Special handling drop tube or overfill drop tube replacement
- Tank top excavation
- Phase II site assessments
- And more...

In some cases, these services are provided by Tanknology's certified technicians. In others, our Project Manager may contract for a portion or all of the service from a Tanknology-approved vendor, then schedule and coordinate the work in conjunction with aspects of the project that we are handling.

Each situation is unique, so the Project Manager will provide a detailed scope of the work to be performed, the cost and the timeline. Our goal is always to provide the highest quality solution, on time, and on budget.

To discuss a specific project or learn more about our Project Management services, call us at 1-800-964-1250.
